# Foreword

The Government of Rwanda requires timely and accurate information to monitor progress on poverty reduction. The country's strategies and targets for poverty reduction are outlined in key policy frameworks, including the second National Strategy for Transformation (NST2), the 2030 Sustainable Development Goals (SDGs), and Vision 2050.

The 2023/24 Integrated Household Living Conditions Survey (EICV7) is the seventh in a series of surveys that began in 2000/01. It also marks a break from previous rounds, as the methodology for data collection, processing, and poverty measurement was substantially revised to align with emerging best practices. Consequently, the poverty rates from this survey round mark the beginning of a new series.

This report focuses on poverty, presenting the main findings related and offering a detailed profile of the poor—an essential step in the ongoing efforts to identify vulnerable populations and address the challenge of eliminating poverty.

Companion reports provide in-depth analysis on thematic areas including education, utilities and amenities, economic activities, agriculture, gender, youth, and multidimensional (as opposed to solely monetary) poverty

The EICV7 survey revealed that 27.4% of the population was living in poverty in 2023/24. Modelling shows that if the same methodology had been applied in 2016/17, the poverty rate at that time would have been 39.8%. This represents a reduction in poverty of just over twelve percentage points over seven years. This is a significant drop in poverty, but it is also clear that much remains to be done in order to eliminate poverty.

I extend my sincere thanks to the National Institute of Statistics of Rwanda (NISR) for their excellent work on EICV7, and for the diligence, integrity, and professionalism that they demonstrated throughout the process of collecting, analyzing, and reporting the data for this report. I am also deeply grateful to the many collaborators ranging from the thousands of households who patiently answered the long survey questionnaire, to those who provided financial and technical assistance – whose inputs were essential to the successful production of this important report.

I encourage all stakeholders—government agencies, researchers, development partners, and the public—to utilize the findings of the EICV7 effectively to drive impactful actions that improve the lives of Rwandans.

Yusuf MURANGWA

Minister of Finance and Economic Planning

# Acknowledgements

The Seventh Integrated Household Living Conditions Survey (EICV7) was conducted from October 2023 to October 2024, building upon the strong foundation of previous EICV surveys. Designed to provide timely and updated statistics, EICV7 supports the monitoring and evaluation of policies and programs related to poverty and wellbeing.

The protocols used to survey households and the methodology applied to measure consumption and poverty were significantly revised for EICV7 to align with evolving best practices. While the updated methodology is more robust, caution is advised when comparing the EICV7 results with those of previous EICV surveys, especially on poverty estimates. The NISR typically conducts an EICV survey every three years, a frequency made possible by the strong collaboration of our stakeholders and their support, as they share our commitment to evidence-based decision making and planning processes grounded in reliable, valid, and regular statistics.

We sincerely thank the thousands of households that participated in EICV7 for their willingness to provide data is the foundation of this report. The insights gained will play a key role in shaping policies and programs aimed at improving the living conditions of all Rwandans.

We extend our sincere gratitude to the Government of Rwanda for its strong commitment to the development of statistics in the country. Special thanks go to the Ministry of Finance and Economic Planning, as well as other government ministries and agencies, for their support and facilitation throughout the survey process. We are particularly thankful to our development partners for their vital financial and technical support. Our special appreciation goes to the World Bank team, especially Juan Carlos Parra, Christian Camilo Gomez Canon, and Nobuo Yoshida for their technical inputs during the EICV7 implementation.

We also appreciate the support of national and international experts, whose technical contributions enhanced the quality of data analysis and reporting. The EICV7 management team deserves special recognition for their dedication and effective coordination throughout the planning, data collection, and analysis phases of the survey.

Finally, we are truly grateful to the field teams and data processing staff for their professionalism and resilience during this survey round. The implementation of this survey required the efforts of approximately 240 people, including field workers, data quality monitors, IT personnel, cartographers, analysts and report designers. Their commitment was instrumental in ensuring the production of high-quality data and reports. Additionally, we acknowledge the invaluable support provided by the administrative and finance department of the National Institute of Statistics of Rwanda (NISR), which ensured the smooth execution of this exercise.

MURENZI Ivan  
Director General, NISR

# Important technical notes for data users

The Seventh Integrated Household Living Conditions Survey (EICV7) was conducted from October 2023 to October 2024, building upon the strong foundation of previous EICV surveys. Since 2010, an EICV has normally been conducted every three years, but the EICV6 was interrupted by the Covid19 pandemic, leading to a gap in the survey series. Consequently, through different EICV7 reports, the comparisons of different indicators will primarily focus on EICV5, which was undertaken in 2016-17, and is the most recent fully completed survey prior to EICV7.

## Sampling

The EICV7 has two main components: a large cross-sectional sample of nationally-representative households, and a Vision Umurenge Program (VUP) survey of households receiving VUP benefits. The EICV7 data collection was covered in a period of 12 months (October 2023 to October 2024). In order to represent the seasonality in the income and consumption data, the data collection was divided into nine nationally-representative cycles for the fieldwork.

The NISR developed a Master Sample of primary sampling units (PSUs) based on the data from the 2022 Rwanda Census of Population and Housing, which was designed to provide samples for various national household surveys during the intercensal period, including the EICV. Samples were drawn from each of the country's thirty districts ("strata"). Within each stratum, the Master Sample PSUs were selected with probability proportional to size (PPS), using the number of households enumerated in the Census as the measure of size for each Enumeration Area (EA).

In order to determine the sample size for the EICV7, NISR examined the EICV5 data to compute the sampling errors and 95% confidence intervals for the estimates of the poverty rate at the district level. Although the level of precision of the EICV5 results at the district level was fairly reasonable, NISR decided to increase the sample size slightly and adjust the sample design for the EICV7 to provide an improved level of precision for the district-level results. Concerning the three districts of Kigali, the sample of 72 EAs per district, and 54 EAs in districts outside the city of Kigali, were selected from the master sample for the first sampling stage. Overall, a sample of 1,674 EAs was distributed across nine data collection cycles over 12 months.

Within each district, the sample EAs were allocated to the urban and rural strata in proportion to the total number of households in the Census frame. For each sampled cluster, a comprehensive listing operation of all households in the EA was conducted to update the household count in the Master Sample.

At the second sampling stage, nine households per sample EA for all districts were selected. In order to distribute the sample interviews and facilitate the logistics during the data collection period over the 12-months, the sample EAs were divided into nine cycles of about 40 days each. To further facilitate the enumeration of two sample EAs by a team, three sub-cycles of 12 days each were created from every cycle. For the team to be able to rest and reach the sample EAs assigned to the next sub-cycle, one day off was given among every sub-cycle and two days among cycles.

In each district of Kigali, eight sample EAs were enumerated in each cycle while six were enumerated in districts outside of Kigali. With the aim to ensure high response rates, a random selection of three households was added to the nine-existing households, for the provision of replacement where need be. The response rate was more than 99% at the end of the survey.

The VUP Survey, conducted alongside EICV7, targeted households who benefitted from any of the seven VUP components. The sampling frame was derived from a comprehensive beneficiary database. A stratified two-stage sampling approach was used, with EAs of beneficiaries as PSUs, and nine households sampled per EA. Stratification was based on the predominant VUP component within each EA. Adjustments were made for smaller components to ensure adequate representation.

## Data collection operations and quality assurance

The comprehensive EICV7 operations involved careful planning, training, and execution to ensure the data collected was of high quality. In July 2023 throughout the pilot survey in the preliminary phase, 15 experienced enumerators were trained for two-weeks. Following the training, the enumerators conducted a two-week field test to refine tools and methodologies. The overall training of enumerators, which lasted one month (August to September 2023), was followed by two weeks of practical exercises to simulate real scenarios in the assigned districts before the main data collection.

During the training sessions, a number of enumerators were equipped with skills to measure non-standard units. Each team of enumerators had one enumerator who was in charge of collecting information from local markets and restaurants. NISR used the collected information regarding non-standard units to convert consumed non-standard unit items by the household into standard units. The information obtained from the local restaurants has also been used to value the food calories consumed outside the home.

Another key component of EICV7 was the extension of price data collection to cover the urban and rural areas of all the 30 districts of the country. For this purpose, a team of 17 price data collectors was trained and deployed in the field during 12 months from October 2023 to October 2024 to supplement the usual Consumer Price Index (CPI) team.

The NISR collected data for the EICV7 using computer-assisted personal interviewing (CAPI) with tablets, and the data was transmitted to the server on a daily basis. Data quality was assured through robust mechanisms, including daily inconsistency checks, monitoring key indicators, and regular field supervision. Daily reporting systems facilitated real-time tracking and resolution of issues, while cycle-end reports provided comprehensive updates on the ongoing field activities.

## Important changes in EICV7

The EICV7 survey incorporates significant methodological advances to provide a more accurate and comprehensive assessment of poverty in Rwanda. The methodology of poverty measurement used in the previous EICVs was built on EICV1, which was launched 25 years ago, and there was a need to reconsider it and, when necessary, update the methods used to collect and process the data.

Because of the differences in data collection methods and scope between EICV7 and earlier EICV surveys, it is not possible to directly compare the new consumption and poverty variables with those of earlier surveys, although most other socio-economic indicators remain comparable. For consumption and poverty, we used advanced modeling techniques to allow some comparability over time.

Among the more important changes were:

- Fewer visits per household (5 instead of 8 or 11);
- Information on food collected over a seven-day period (instead of 14 or 30 days);
- Separate questions on food acquisition and consumption allows for a true measure of food consumption;
- More-detailed questions on food consumed away from home, and on school meals, allow these to be included in consumption;
- Additional questions to allow for the measurement of gifts and in-kind payments for non-food items;
- A revised, and more realistic, method to compute the use value of durable goods;
- Deflation to the prices of January 2024 uses individual household-level Paasche deflators, rather than the regional-level indexes used in EICV5;
- The adult equivalence scale has been redefined to allow for economies of scale in non-food consumption;
- The poverty line starts with a calorie threshold of 2,400 kcals/adult equivalent/day (instead of 2,500), and values it using the consumption pattern of households in the second quintile (rather than the bottom two quintiles).

## Triangulation with other sources of data

The triangulation of EICV7 data with other sources, particularly the 2022 General Population and Housing Census (GPHC) as well as other administrative data, provides an opportunity to validate key findings and ensure consistency across national statistics. However, for some indicators, this process faces challenges in achieving accurate comparability, due to the differences in reference periods and methodological approaches across sources. Therefore, direct comparisons should be done with caution, taking in account that limitation.

## Rounding of estimates

Estimates displayed in the tables are generally shown rounded to one decimal place. To improve the readability, estimates referring to the interpretation of results have been rounded to the nearest integer, except for the discussion of relatively small percentages. Moreover, estimates of total population or total number of households are shown in tables expressed in '000's. Due to the rounding, the subpopulation totals (e.g. provinces or age groups) can be marginally different from the total population estimated at the national level.

## Consumption quintiles

The results are presented by quintile. Quintiles are developed by sorting the sample of households by the value of annual consumption per adult equivalent, and then dividing the population into five equal shares. The 20% of individuals with the highest annual consumption are allocated to quintile five, and the 20% of individuals with the lowest level of annual consumption are allocated to the first quintile.

# Executive summary

## Background to the EICV7 and the EICV series

The EICV7 survey conducted over a period of 12 months from October 2023 to October 2024 using Computer-Assisted Personal Interviewing (CAPI) technique as primary method of data collection. The EICV7 has two main components: a cross-sectional sample of households and VUP Survey among VUP beneficiaries.

The EICV7 cross-sectional survey is designed to represent the Rwanda's current household-based population. The primary sampling units (PSUs) are enumeration areas (EAs) defined by the 2022 Rwanda general population and housing census. These EAs were stratified by district as well as urban and rural areas and selected with probability proportional to size (PPS) approach using the number of households as the measure of size. A sample of 1,674 EAs were distributed across nine data collection cycles over 12 months to capture seasonal variability. In the second stage, nine households were systematically sampled within each EA, with provisions for replacements of 3 household per cluster to ensure high response rates. The response rate was more than 99%.

The main objective of the VUP survey is to measure the socioeconomic characteristics of VUP beneficiaries at national level. The sampling frame was derived from a comprehensive beneficiary database from LODA. A stratified two-stage sampling approach was used, with clusters of beneficiaries as PSUs and nine households sampled per cluster. Stratification was based on the predominant VUP component within each cluster.

The EICV7 aims to provide timely and updated statistics to facilitate the monitoring of progress on poverty reduction programs and the evaluation of various different policies as outlined in the second National Strategy for Transformation (NST2), the 2030 Sustainable Development Goals (SDGs) as well as the Vision 2050.

This report primarily compares results from EICV7 with those of EICV5 conducted in 2016/17, as the EICV6 (2019/20) was interrupted by the COVID-19 pandemic and therefore could not provide comprehensive data. The analysis highlights developments over time and examines patterns across Rwanda's provinces, urban and rural areas and districts where appropriate. Particular emphasis is placed on presenting disaggregated results for men and women, to explore gender-related aspects of key social and economic characteristics of individuals and households in Rwanda.

## Water and sanitation

EICV7 shows the progress observed in the use of improved drinking water source (90% compared to 87% in EICV5) over the period of six years at national level. Usage rates were higher in urban areas (97%) compared to rural areas (87%). At national level, 36% of households are within 0-4 minutes walking distance of an improved drinking water source while 70% of households are within 0-14 minutes walking distance one-way). Regardless of whether households share toilet facilities with other households, the percentage of households with access to improved sanitation facilities increased from 86% in 2016-17 to 94% in 2023-24. However, when considering only improved toilet facilities that are not shared with individuals from other households, the percentage rose from 66% in 2016-17 to 72% in 2023-24, reflecting an increase of six-percentage-points.

## Energy

The survey also provides information about the main source of energy for households lighting and cooking, types of cooking stoves and cooking stove installation place. Moreover, it provides information on the national grid connectivity and reasons for not being connected to the grid. In urban areas, the majority (51%) of households use charcoal as cooking fuel. In rural areas, firewood remains the most used type of cooking fuels, (92.5%). The traditional stove (three

stones) is the mostly used cooking stove (36%) by the households followed by improved cooking stove (34%), charcoal or fire stove with 22% and gas, electric, or biogas cookstoves, used by 5% of households. EICV7 also shows that, 60% of the households set up their stoves in a separate dwelling. 18% of the households install their stoves outdoor and 4% in the same dwelling in a sleeping area. At national level, use of electricity for home lighting has increased since 2016-17 from 27% to 72% in 2023-24. The highest percentage of households using electricity for home lighting was found in City of Kigali (92%). In other provinces the percentage of households using electricity for home lighting ranges between 64% and 71%. The data reveals that 50% of Rwanda's 3.29 million households are connected to National grid, while 22% rely on solar power. Approximately, 1% of households are both connected to the National grid and solar power. The EICV7 also provides insights into various challenges that prevent households from connecting to the National grid. The main reasons include absence of grid lines in the area (41.5%), high connection cost (37%), pending applications (13%). Other challenges, each reported by approximately 3% of households, include living in inappropriate dwellings, complex administrative procedures, and other unspecified reasons.

## Housing

The EICV5 results show an increase of nine-percentage-points for households living in Imidugudu from 59% in 2016-17 to 68% in 2023-24. Single house dwelling has decreased from 89% in 2016-17 to 85% in 2023-24. This type of dwelling is more common in rural (93%) areas than in urban areas (66%) and especially in the Northern Province (94%) in 2023-24. EICV also provides information on construction materials used for roofs, walls, and floors in Rwanda. The use of metal sheets as roofing material has become more common across the country, with a rate of 76% at national level in 2023-24 compared to 67% in 2016-17. This increase is also observed in the lowest quintile from 57% in 2016-17 to 65% in 2023-24. Most of the households in Rwanda use mud bricks without cement as wall construction materials (28%), while those using tree trunks with mud have decreased in rural areas from 27.5% in 2016-17 to 21% in 2023-24. The percentage of households that use mud bricks covered with cement has increased notably from 30% in 2016-17 to 42% in 2023-24 at national level. Beaten earth is the mostly used flooring material in Rwandan dwellings. However, it has decreased from 68% in EICV5 to 58% in EICV7. The percentage of dwellings with cement as flooring material has increased from 26% in 2016-17 to 35% in 2023-24. In urban areas 60% of households have cement as flooring material compared to only 24% of households in rural areas. The use of tiles as flooring material has risen from nearly 2% in 2016-17 to 4% in 2023-24 nationwide. The tiles are predominantly used by households in urban areas (14%), marking an increase of six-percentage-points from 8% since 2016-17. Furthermore, the survey presents data on households with rain-water management system. Results show that 22% of households in Rwanda have a way of managing rainwater. Compost heap and thrown in bushes/fields remain the method that households widely use for rubbish disposal (48.5% and 38.5% respectively in EICV7). Regarding access to basic services and infrastructures, the data show that the mean walking time to services such as markets, health centres, primary and secondary schools in rural areas has reduced. For instance, the proportion of households walking more than 2 hours to reach a health centre declined from 8% in 2016-17 to 7% in 2023-24, while those walking 0-30 minutes to a health centre increased significantly from 22% in 2016-17 to 30% in 2023-24.

## Transport

The survey provides information on the distance to transport infrastructure, usage and perception of change in quality in the last 12 months. It also provides information on household ownership of transportation assets such as vehicles, bicycles, and motorcycles. The percentage of households accessing all-weather roads regularly or often has increased by one-percentage-point, from 98% in 2016-17 to 99% in 2023-24 at national level. The majority of rural households (95%) walk to an all-weather road in less than 20 minutes. The mean distance (in meter) to an all-weather road is (287 meters) at national level in 2023-24; 67% of the households are within 200 metres and 86% are within 500 metres. Considering the threshold of two kilometers, accessibility to all-weather roads is very high to households in all regions. In urban areas, 100% of households are within 2 km to an all-weather road and 97% in rural areas. At national level, 62%

of households were satisfied with their nearest all-weather road in 2023-24. On the perceptions of changes in quality of all-weather road, 20% of respondent households think it has improved and 68% feel that the quality of all-weather roads has remained the same. The usage rate of public transport stages, in 2016-17 stands at 76% in urban areas compared to 53.5% in rural areas. 17% and 54% of rural and urban households respectively walk less than 20 minutes to a public transport stage. Majority of private vehicle (not for commercial) owners fall within the richest quintile in both surveys. In urban areas, approximately 2% of households own a motorcycle and 6% own a car in 2023-24. Ownership of bicycle is much higher in rural areas (16%) compared to urban areas (12%) in EICV7.

## ICT

This report provides data on access to ICT devices and services (like mobile phones, computer, etc.) among households. Household ownership of ICT devices has increased significantly between EICV5 and EICV7. 85% of households owned at least one mobile phone, 86% owned a radio, 14% owned a TV set, and 7% owned a computer in 2023-24. Overall, 30% of the households had access to internet at home in 2023-24, this has almost increased by thirteen-percentage-points at the national level from 17% since 2016-17. 56% of households in urban areas had internet access compared to 19% in rural areas. Mobile phones are the most common used modes of accessing internet at home (96%) followed by Landline or Cable internet (2.5%), and wireless (about 2%) in 2023-24. Households not owning an ICT device may still use public ICT services such as public internet service facilities. In 2023-24, 42% of households use public internet facilities in Rwanda (regularly and often), rising from 1% in 2016-17, which represents a forty-onefold increase. The highest usage rate is observed in the Northern Province (51%), followed by the City of Kigali (44%) and the Southern Province (42%), the Western Province has the lowest usage rate at 33%. The user satisfaction level is very high across the country among the households using public internet services. In 2023-24, 97% of households are satisfied with their nearest internet services, marking an increase of six-percentage-points from 91% in 2016-17. This high level of satisfaction is consistent across regions, with 98% in urban areas and 97% in rural areas.

# Introduction

In line with Rwanda's long-term development aspirations as embodied in Rwanda Vision 2050, the Second National Strategy for Transformation (NST2 2024-2029) mainstreams a system of monitoring and evaluation at national, provincial, district and sectoral levels of the government's socio-economic performance. The overall aim of National Strategy for Transformation and vision 2050 is to increase Rwanda's Economic growth, with the specific objective of speeding up Rwanda's progress towards an upper middle-income country by 2035 and high-income country by 2050.

The evidence collected through the EICV7 fieldwork carried out by the NISR between October 2023 and October 2024 provided key inputs into the evaluation of development programmes such as the Second National Strategy for Transformation, Sustainable Development Goals, Vision 2050, AU Agenda and EAC Vision 2050.

This report is one of ten different thematic reports namely: Poverty profile, Youth, Gender, Economic Activity, Utilities and amenities, Education, Agriculture, VUP, MODA, and MPI, which will play a key role in the final evaluation of the First National Strategy for Transformation and evaluation of the Second National Strategy for Transformation.

Utilities and amenities Thematic report focuses on water, sanitation, energy, transport, and ICT facilities sectors. This report also explores a wealth of evidence collected through the EICV7. The report further makes use of the fact that the sample sizes of the fifth and seventh rounds of EICV are sufficient to provide estimates that are reliable at the district level.

Following some short methodological notes in the following section, chapter 2 and 3 of this report discuss access to water and sanitation, including safely managed drinking water and sanitation services. They also address national grid connectivity, reasons for lack of grid connectivity, energy sources for households lighting and cooking, types of cooking stoves and its installation location, and use of clean cooking fuel among Rwanda's population. Chapter 4 describes the housing characteristics in Rwanda. Chapter 5 provides information on transport infrastructures. Finally, chapter 6 presents data on access to ICT devices and services among households. The annexes provide district-level estimates for selected key indicators as well as confidence intervals.

## Water and sanitation

This chapter provides information on access to water and sanitation services among the Rwandan population, drawing insights from comprehensive data collected from both surveys (EICV7 and EICV5). Concerning access to water, the main focus is on access to improved drinking water, distance to improved water source, user satisfaction with improved water source, and safely managed drinking water services. When it comes to sanitation facilities, the primary concern is determining whether the households have improved toilet facilities or if they share them with other households. The EICV7 also highlights the status of access to safely managed sanitation services. The findings presented in this section also show the changes between 2016-17 and 2023-24.

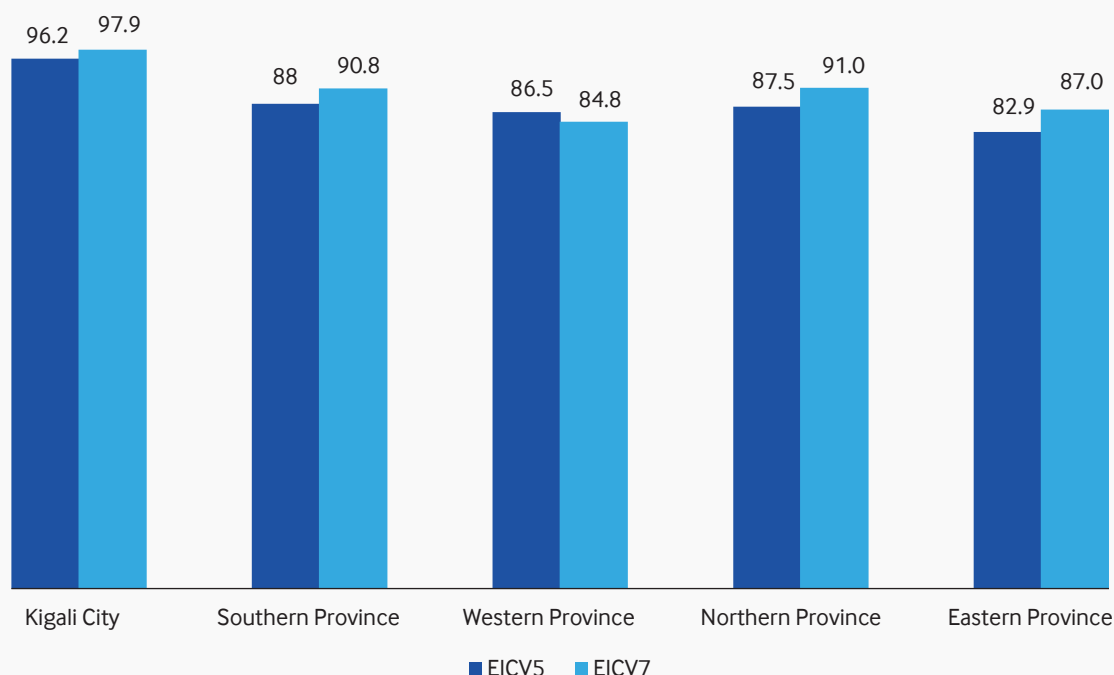

### Drinking water

This section provides insights into households that rely on improved drinking water sources for their main water supply. According to international standards, drinking water sources are classified into two categories: improved or unimproved. Improved drinking water sources include water piped into the dwelling or yard, protected springs, public standpipes, boreholes, protected wells, bottled water, water delivered by tank truck, and rainwater collection. Unimproved drinking water sources consist of unprotected springs and wells, surface water from rivers, lakes, dams, ponds, streams, irrigation channels, and other unspecified sources. As defined by SDG Target 6.1, improved drinking water sources are further classified into three categories: Safely managed, basic, and limited. The safely managed drinking water sources are those located on premises, available when needed, and free from contamination. The Basic drinking water sources provide improved water within a 30-minute round trip collection time, including queuing. When the collection time exceeds 30 minutes for a round trip, including queuing, these drinking water sources are classified as limited. Unimproved drinking water sources are categorized into two groups. The first group, unimproved sources, includes unprotected wells, unprotected springs, and other similar sources. The second group, Surface water, refers to water collected directly from natural bodies such as rivers, dams, lakes, ponds, and streams.

Figure 2.1 and Table 2.1 present the percentage of households that rely on improved drinking water sources. Nationally, there has been a three-percentage-point increase from 2016-17 to 2023-24, reaching about 90%. With respect to the area of residence, the estimate for urban areas increased slightly by one-percentage-point, reaching approximately 97%. In rural areas, there is a modest increase of about two-percentage-points, bringing the estimate to around 87%. At provincial level, City of Kigali stands out with the highest percentage of households (about 98%) using improved drinking water sources, compared to other provinces. This presents an increase of two-percentage-points compared to the 2016-17 estimate. A larger percentage of households in Kigali rely on piped into dwelling /yard (about 31%), public standpipes (around 24%) and bottled water (about 16%) for their water supply. In contrast, the Western Province ranks fifth, with the lowest percentage of households using improved drinking water sources in EICV7, at approximately 85%. Notably, for the other three provinces outside the City of Kigali, there has been a modest increase of between three and four percentage-points from 2016-17 to 2023-24. However, the Western Province shows a decrease of two-percentage-points, dropping from about 87% in 2016-17. This may be related to landslides and flooding disaster which damaged infrastructures including water supply system.

**Figure 2.1: Change in households with improved drinking water source by province (Percentage)**

Source: National Institute of Statistics of Rwanda (NISR), EICV5 & EICV7.

A similar improvement was noticeable when examining the quintile level, where the percentage of households using improved drinking water sources increased by two-percentage-points in the lowest quintile, contrasted with three-percentage-points increase in the highest quintile.

The utilization of improved drinking water source may be correlated with the type of habitat, as shown by households residing in modern planned areas and umudugudu settlements predominantly relying on such sources of drinking water. The prevalence of improved drinking water sources in these specified habitats increased by approximately one to two percentage-points between 2016-17 and 2023-24, rising from 99% to 100% and 87% to 90%, respectively. In contrast, households inhabiting other types of habitats, such as dispersed or isolated housing exhibited the poorest access to improved drinking water sources, with a slight increase from 81% to 82% over the indicated six-year period. The findings indicate minimal disparity in the use of improved drinking water source between households headed by males and females in both surveys.

**Table 2.1: Distribution (% and count) of households by main source of drinking water, according to province, area of residence, quintile, habitat, disability status and sex of head of HH**

The data presented in Table 2.2 demonstrate comparable trends at population level, with 89% of the population using an improved drinking water source in 2023/24, compared to 87% in 2016/17. This indicates two-percentage-points increase during the specified period.

<sup>1</sup> The slight difference in EICV5 estimate for improved drinking water sources between 2016-17 and the 2023-24 EICV7 report is due to the 2022 WHO and UNICEF reclassification, which recognized "Tank truck" as an improved drinking water source.

Table 2.3 shows the mean distance to the nearest main improved drinking water source. At the national level, 32% of households were located within 0-200 meters of an improved drinking water source in the 2023-24 (EICV7), compared to 25% in the 2016-17 (EICV5). This figure includes households with water piped into the yard/dwelling, those reliant on bottled water and those accessing improved drinking water sources within a 200-meters radius. When considering a threshold of 500 meters, the data reveals that 55% of households in Rwanda are within 500 meters of an improved drinking water source in 2023-24, representing a notable thirteen-percentage-point increase from the 42% reported in 2016-17. Furthermore, the data highlight a substantial proportion of rural households must travel long distance to reach an improved drinking water source, with only 19% residing within 0-200 meters, a three-percentage-point increase from 16% reported in 2016-17 and 44% situated within 0-500 meters, reflecting a ten-percentage-point increase from the 34% recorded in 2016-17. In contrast, urban households reveal that 63% are within 0-200 meters in 2023-24, down from 65.5% in 2016-17, while those within 0-500 meters of an improved drinking water source amount to 80% in 2023-24 (EICV7) and 79% in 2016-17 (EICV5).

The data presented in Figure 2.2. show a decline in the proportion of households within 0-200 meters of an improved drinking water sources in urban areas and with 0-500 meters in rural areas between 2016-2017 and 2023-2024. In urban areas, approximately 62% of households had access to an improved drinking water source within 200 meters in 2023-24, compared to 70% in 2016/17, representing a decrease of eight-percentage-points over the specified period. In rural areas, 48% of households had access to an improved water source within 500 meters in 2023-24, down from 54% in 2016-17, indicating six-percentage-points decline over the same timeframe.

**Figure 2.2: Percentage of HHs using an improved drinking water source that is within 200m in urban and 500m in rural**

Source: National Institute of Statistics of Rwanda (NISR), EICV5 & EICV7.

Regarding the time required to access improved drinking water sources, the data in Table 2.4 indicate a national-level improvement. The proportion of households walking less than 15 minutes to an improved drinking water sources increased from 61% in 2016-17 to 70% in 2023-24. Additionally, the percentage of households spending more than 15 minutes to reach an improved drinking water sources declined from 19% in 2016-17 to 11% in 2023-24. As illustrated in Figure 2.3, the percentage of households walking less than 15 minutes has increased across all provinces and the City of Kigali. The most significant improvement was recorded in the Southern Province, where the share of households with quicker access increased by fifteen-percentage-points.

Source: National Institute of Statistics of Rwanda (NISR), EICV5.

The findings in Table 2.5 highlight the main reasons for not using the nearest drinking water sources. The most significant reason reported is related to non-functioning or improperly working water sources, which accounted for 59% in EICV7. This is followed by expensive water, which was reported at 30% in EICV7, showing an increase of nine-percentage-points from 21% in EICV5. Across provinces, the Eastern province has the highest level of non-functioning or improperly working drinking water sources, reported at 68% in 2023-24. In contrast, both the Western Province and the City of Kigali cite water as expensive, with rates of 35% each in 2023-24.

**Table 2.5: Distribution (% and count) of households not using the nearest drinking water source and main reason, by province, area of residence, consumption quintile, habitat, disability status and sex of head of HH**

EICV7	Households not using the nearest drinking water source	Reasons for not using the nearest drinking water source						Total	Nber of HHs (in 000s)
		Too expensive	Does not function/ Doesn't work properly	Difficult terrain	Not safe	Long queue	Other reasons

Table 2.6 shows the levels of user satisfaction with the main drinking water source used by households. The results indicate an overall decrease in user satisfaction by eight-percentage-points, from 53% in 2016/17 to 45% in 2023/24. At the provincial level, user satisfaction has decreased in almost all provinces, except for the Eastern province which recorded an increase of three-percentage-points, rising from 45% in 2016-17 to 48% in 2023-24. The City of Kigali has the highest decrease in satisfaction, with a drop of twenty-percentage-points from 54% to 34% over the same period. The Western province also shows a decrease in satisfaction, dropping fourteen-percentage-points from 55% to 41%. The decrease in satisfaction was also observed across areas of residence. In urban areas, there was a significant decrease of thirteen-percentage-points in satisfaction from 53% to 40%, while in rural areas, there was a decrease of five-percentage-points from 53% to 48%. By wealth quintile, the lowest satisfaction rate (35%) was observed among the wealthiest households (Q5), while the highest (49%) was among the poorest households (Q1). This suggests that satisfaction with drinking water services decreases as households' wealth increases. Regarding the perceived change in service quality, most of the households reported that the quality of water services remained the same over the last 12 months, with 55% in EICV5 and 56% in EICV7.

**Table 2.6: Distribution (% and count) of households by level of satisfaction with main drinking water source and perceptions of changes in quality over the last 12 months, by province, area of residence, consumption quintile, habitat, disability status and sex of head of HH**

Regards SDG Target 6.1, the goal extends beyond providing access to improved drinking water sources by requiring that water be accessible on premises (within the dwelling, plot, or yard), available when needed, and free from contamination. However, the EICV7 did not include testing for drinking water contamination, making it impossible to report on the safely managed drinking water category. Consequently, the estimate presented in Table 2.10 are limited to the categories of: Basic, Limited, Unimproved, and surface water.

As indicated in Table 2.7 of the EICV7 survey, 68% of households in Rwanda have access to basic water services, while 21% have limited access. This brings the total to about 90% of the households having access to an improved drinking water source as shown in Table 2.1. Only about 4% of households use surface water. At the provincial level, the City of Kigali leads with 89% of households using basic water services, followed by the Northern Province with 70%. The Eastern Province ranks lowest, with just 56% of households using basic water services. The data further suggest a correlation

between habitat type and access to water services. Households in Integrated model villages and modern, planned urban areas are more likely to have basic water services (84% and 96%, respectively). Conversely, those in dispersed or isolated housing show the lowest usage at just 57%. Figure 2.4 illustrates a significant disparity in access to basic water services between urban and rural areas. While around 86% of urban households benefit from basic water services, this figure drops sharply to just about 61% for rural households.

## Sanitation

This section provides an overview of household access to sanitation facilities. The facilities are classified into two main categories: improved and unimproved sanitation facilities. Improved sanitation facilities include flush toilets connected to a piped sewer system, septic tank, or pit latrine; ventilated improved pit latrine; pit latrine with constructed floor slab; and composting toilet. Unimproved sanitation facilities consist of pit latrines without a slab or platform, other types of toilet facilities, and open defecation (i.e., the absence of a toilet facility, use of a bush or field). According to SDGs Target 6.2, improved sanitation facilities are further classified into three categories: safely managed, basic, and limited sanitation. Safely managed sanitation refers to improved sanitation facilities that are not shared with other households and where excreta are safely disposed of in situ or transported and treated offsite. Basic sanitation includes improved facilities that are not shared with other households, while limited sanitation refers to improved facilities shared by two or more households. Similarly, SDGs classifications define, unimproved sanitation facilities as either pit latrines without a slab or platform, or open defecation, which involves disposing of human feces in fields, forests, bushes, open water bodies of water, beaches or other open spaces, or alongside solid waste.

Without considering whether households share toilet facilities with members of other households, the results displayed in Table 2.8 shows that the national percentage of households with access to improved sanitation increased from 86% in 2016-17 to 94% in 2023-24. Over the past six years, the percentage of households in all provinces have improved their access to improved sanitation. The City of Kigali has consistently recorded the highest percentage of households with access to improved sanitation in both surveys, with 94% in 2016-17 and 99% in 2023-24. Conversely, the Southern province has reported the lowest percentage, with 75% in 2016-17 and 91% in 2023-24. Notably, the Southern Province has shown the largest increase in households with access to improved sanitation, achieving sixteen-percentage-points increase from 75% in 2016-17 compared to all other provinces.

Furthermore, the survey provides information on whether a household shares the toilet with individuals from other households. At the national level, 72% of households used an improved toilet facility not shared with other households in 2023-24, this shows, six-percentage-points increase from 66% in 2016-17. Rural areas have the highest percentage of households with unshared improved toilet facilities, with about 80% in 2023-24 compared to 71% in 2016-17, showing almost nine-percentage-points increase. In contrast, households in urban areas show a ten-percentage-points increase from 45% in 2016-17 to 55% in 2023-24 in the use of unshared improved toilet facilities. The higher percentage of rural households with unshared toilet facilities may be attributed to more space and less crowding. In urban areas, more households tend to use shared facilities due to space limitations or living in buildings with multiple households. At the provincial level, the percentage of households utilizing unshared improved toilet facilities follows a similar pattern to the area of residence. The City of Kigali has the lowest percentage of households using unshared improved toilet facilities with 47%, followed by the Southern Province with 75%. Despite being the second lowest, the Southern province has shown a significant increase of fourteen-percentage-points from 61% in 2016-17 compared to other provinces. The highest percentage of households using unshared improved toilet facilities, 83%, was observed in the Northern Province.

**Table 2.8: Distribution (% and count) of households using improved sanitation, by type of sanitation used, according to province, area of residence, consumption quintile, habitat, disability status and sex of head of HH**

The results presented in Table 2.9 illustrate the status of the Sustainable Development Goals (SDGs) related to sanitation access in Rwanda. Countrywide, about 68% of the households have access to safely managed sanitation services, while about 5% have access to basic sanitation facilities, and about 22% have limited access. This amounts to a total of around 94% of the households having access to improved sanitation facilities as shown in Table 2.8. At the provincial level, the City of Kigali records the highest percentage of households with access to limited sanitation facilities, at 53% in 2023-24. In contrast, other provinces outside the City of Kigali show a narrower range, with access to limited sanitation facilities varying between 12% and 18%. Both the Western and Eastern provinces report approximately 18% of households relying on limited sanitation facilities, while the Southern province follows with 16%. Notably, the Northern province has the lowest percentage of households with access to such facilities, standing at 12%.

Figure 2.5 indicates that nationwide, open defecation has nearly been eradicated, with only 1% of the households still engaging in this practice. The rate is slightly higher in rural areas at 1%, while it is almost nonexistent in urban areas, recorded at just 0.3%. A notable finding is the disparity in “limited sanitation” between rural and urban areas. In rural areas, 13% of the households use limited sanitation facilities, while in urban areas, this figure rises to 43%. This trend suggests that urbanization is leading to a greater reliance on shared toilet facilities, which contributes to the higher usage of limited sanitation in urban areas.

## Energy

This chapter provides information on the national grid connectivity, reasons for not being connected to the grid, main sources of energy for lighting and cooking in households, use of clean cooking fuel, types of cooking stoves, and installation locations of cooking stoves. The data are derived from both the EICV5 and EICV7 surveys, offering insights into the population of Rwanda. Additionally, the chapter highlights the progress made between 2016-17 and 2023-24.

### National Grid Connectivity and reasons preventing household connections

This section provides insights into households' connectivity to the National grid in Rwanda. Table 3.1 illustrates the distribution of households by connection to the National grid and solar power, disaggregated by province, area of residence, consumption quintile, type of habitat, and sex of the household head. The data reveal that 72.5% of Rwanda's 3.29 million households have access to electricity. Among these, 50% are connected to the National grid, 22% rely on solar power, and approximately 1% of households have dual access to both the National grid and solar power. At provincial level, the city of Kigali records the highest connectivity rate, with approximately 91% of households connected to the National grid, while the Southern Province reports the lowest rate at 34.5%. Consequently, in the Southern Province, about 36% of households have not access to both the National grid and solar power. However, the Southern Province also displays the highest percentage of households connected to solar power, at approximately 29%. When analyzed by consumption quintile, households in the richest quintile show the highest connectivity to the National grid at 80%, compared to about 30% for those in the poorest quintile. Connectivity to the National grid also appears to be linked to type of habitat. The data shows that, 95.5% of households in modern planned areas, 57% in integrated model village, and 51% in planned rural settlements (umudugudu) were connected to the National grid. When examining the sex of the household head, the data indicates that National grid connectivity was more prevalent among male-headed households (about 52%) compared to female-headed households (about 45%).

Source: National Institute of Statistics of Rwanda (NISR), EICV7.

The data presented in Figure 3.1 indicates that 27.5% of the households in Rwanda have not access to both the National grid and solar power in 2023-24. As illustrated in the figure, the proportion of households connected to the National grid is significantly higher in urban areas (approximately 83%) compared to rural areas (around 36%).

**Figure 3.1: Percentage of HHs by connection to the National grid and solar power, EICV7**

Source: National Institute of Statistics of Rwanda (NISR), EICV7.

The data presented in Table 3.2 highlights the proportion of households by reasons for not being connected to the National grid in 2023-24. A total of 904 thousand households in Rwanda reported various challenges preventing their connection to the National grid. The most common reason cited by 41.5% of households, is the absence of grid lines in their area. The second reported reason, affecting 37% of the households, is the high cost of connection fees or installation equipment. Additionally, 13% of households reported pending applications as the reason for not being connected. Other challenges include living in inappropriate dwellings for grid connection and complicated administrative procedures, each reported by approximately 3% of households. Finally, about 3% of households mentioned other unspecified reasons.

When comparing urban and rural areas, notable differences emerge. In urban areas, 46% of households reported the high cost of connection fees or installation equipment as the main barrier, compared to 36% in rural areas. Conversely, pending applications were reported by around 13% of households in both urban and rural areas. Complicated

administrative procedures were more prominent in urban areas, affecting about 4% of households, compared to 2.5% in rural areas. Gender-based differences in reasons for not being connected to the National grid are minimal. Both male- and female-headed households reported similar percentages for complicated administrative procedures and inappropriate dwellings as barriers, at approximately 3% each.

**Table 3.2: Distribution (% and count) of households by reasons for not being connected to the national grid, according to province, area of residence, consumption quintile, type of habitat, disability status and sex of the HH head**

EICV7	Reasons for not being connected to electricity						Total	Nber of HHs neither on grid nor solar powered (in 000s)
	High cost of connection fee/ installation equipment	Dwelling inappropriate for connection	Application pending	Service unavailable (No grid line in the area)	Administrative procedure is complicated	Other reasons

## Sources of Energy for cooking and home lighting

This section provides information on the main fuel used by Rwandan households for home lighting. According to the findings in Table 3.3, the percentage of households using electricity from REG or other distributors for home lighting has increased significantly, representing nearly a quarter of all households (an increase of twenty-three-percentage-points) at the national level. This figure has risen from 27% in 2016-17 to 50% in 2023-24. The upward trend in the use of electricity from REG or other distributors for home lighting is consistent across all provinces. Notably, access to electricity is particularly high among households in City of Kigali, where the rate has increased from 78% in 2016-17 to 90% in 2023-24. However, the City of Kigali has experienced a smaller increase of twelve-percentage-points compared to other provinces, where the increase has exceeded twenty-percentage-points in each province. The Eastern Province

has seen the highest increase of twenty-seven-percentage-points from 18% in 2016-17 to 45% in 2023-24, followed by the Western Province with an increase of twenty-six-percentage-points from 22% in 2016-17 to 48% in 2023-24.

Despite the growing use of electricity from REG or other distributors, the use of solar panels as a source of home lighting has also shown a significant increase of fifteen-percentage-points, rising from 7% in 2016-17 to 22% in 2023-24. At national level, Flashlight/Phone is the second most popular energy source for home lighting in 2023-24, accounting for 25% of households. This represents a decrease of eighteen-percentage-points from 43% in 2016-17.

**Table 3.3: Distribution (% and count) of households by primary fuel used for lighting, according to province, area of residence, consumption quintile, habitat, disability status and sex of head of HH**

Another notable finding is the significant and consistent decline in the use of lanterns as the primary source of home lighting, from 3.5% in EICV5 to nearly zero (0.2%) in EICV7. The Figure 3.2 highlights a substantial increase in the proportion of households with access to electricity in rural areas, rising by fifty-percentage-points from 15% in EICV5 to 65% in EICV7. While households in urban areas, experienced an increase of twelve-percentage-points, from 76% in EICV5 to 88% in EICV7. Additionally, the same figure reveals a notable rise in electricity usage among households in the lowest consumption quintile, which increased by forty-eight-percentage-points, from 5% in EICV5 to 53% in EICV7. Comparatively, households in the richest consumption quintile experienced an increase of thirty-percentage-points, from 62% in EICV5 to 92% in EICV7. These trends align with government programs aimed at improving the living conditions of low-income households.

**Figure 3. 2: Changes in household access to electricity (Percentage)**

Table 3.4 highlights the distribution of households by primary cooking fuels, disaggregated by province, area of residence, wealth quintiles, type of habitat, disability status, and sex of the household head. The data show a slight decrease in the use of firewood for cooking over the past six years. However, at the national level, firewood remains the most widely used cooking fuel, with usage decreasing from 80% in EICV5 to 75% in EICV7. Charcoal is the second most common cooking fuel, with usage increasing slightly from 17% in EICV5 to 19% in EICV7. In urban areas, most of the households use charcoal as their main source of cooking fuel (51%), in contrast to rural areas where firewood is still the predominant cooking fuel, used by 92.5% of households in 2023-24. Although the use of gas or biogas remains low (5% in EICV7 and 1% in EICV5), there has been a noticeable increase over the six-year period. A moderate improvement of around two-percentage-points in the use of gas or biogas as a cooking fuel was observed across most provinces. Notably, in the City of Kigali, there has been a significant increase of seventeen-percentage-points, from 6% in 2016-17 to 23% in 2023-24. The survey also provides information on secondary and tertiary sources of energy for cooking. Details on these alternative cooking fuels are presented in Annex A, specifically in Table A.10 and Table A.11.

The EICV7 also provides information on the use of clean cooking fuels that are environmentally sustainable and contribute to reducing carbon emissions. The clean fuels considered in EICV include Electricity, Solar energy, biogas, and Liquefied Petroleum Gas (LPG). Aligned with SDG 7.1.2, the use of clean cooking fuels reflects Rwanda's commitment to achieving universal access to affordable, reliable, and modern energy services, while mitigating the health risks associated with indoor air pollution caused by solid fuels. Despite ongoing reliance on traditional solid fuel such as firewood and charcoal, notable progress in adopting clean fuels is observed nationwide, though usage remain low.

According to Figure 3.3, the percentage of households using clean cooking fuels at national level increased from 1% in 2016-17 to 5% in 2023-24, representing four-percentage-points of improvement over the period.

However, significant disparities exist between urban and rural areas. In urban areas, usage rose from 5% in 2016-17 to 17% in 2023-24, marking a twelve-percentage-point increase. In contrast, rural area, usage remains minimal, increasing marginally from 0.2% in 2016-17 to 1% in 2023-24, this indicates substantial challenges in expanding access to clean cooking fuels in these regions. The city of Kigali recorded the highest adoption, with 23% of households using clean cooking fuels in 2023-24, up from 6% in 2016-17, a seventeen-percentage-point increase. In other urban areas outside the city of Kigali, adoption rose from 1% in 2016-17 to 9% in 2023-24, reflecting an increase of eight-percentage-points. Despite these advancements, the nationwide adoption of clean cooking energy remains low, likely due to the persistent high reliance on solid fuels, as detailed in Table 3.4. These findings emphasize the need for sustained efforts to expand access to clean cooking technologies in order to achieve the universal access to modern energy services by 2030, ensuring that no one is left behind.

**Figure 3.3: Percentage of households with primary reliance on clean cooking fuels**

## Cooking stove and stove installation place

This section provides detailed information about the most commonly used cooking stoves. Overall, traditional stoves (three stones) and efficient cookstoves are the most frequently used by households in Rwanda. As indicated in Table 3.5, nearly about 36% of the households used traditional stoves and efficient cookstoves (34%) in 2023-24. The charcoal or fire stove is the second mostly used cooking stove, utilized by 22% of households, followed by gas, electric, or biogas cookstoves, used by 5% of households. At the provincial level, the highest percentage of households using efficient cookstoves was observed in the Southern Province (44%). In contrast, the highest percentage of households using charcoal/fire stoves was recorded in the City of Kigali (59%), followed by the Western Province (19%). The analysis also reveals that gas, electric, or biogas cookstoves are predominantly used in urban households (17%) compared to rural households (1%).

Table 3.6 shows that, at the national level, the majority of households (60% in 2023-24) set up their stoves in a separate dwelling. Additionally, the data indicate that 18% of households install their stoves outdoors, while 4% place them in the same dwelling, specifically in a sleeping area. The City of Kigali and the Southern Province exhibit the highest percentages of households cooking in the same dwelling in a sleeping area, with 6% and 5% respectively. In contrast, the Eastern Province reports the lowest percentage at only 1%. The percentage of households cooking in a separate dwelling was significantly higher in rural areas (67%) compared to urban areas (44%). However, the percentage of urban households that cook within the sleeping area of their dwelling was notably higher than that of rural households (5% compared to 3%).

# Housing

This chapter provides a comprehensive analysis of Rwanda’s housing situation, focusing on various aspects such as the type of dwelling, physical characteristics of housing, waste management facilities, household relocation, rent arrangements, dwellings, and ownership of durables. The estimates presented in this chapter highlight the progress made between EICV5 and EICV7.

## Dwelling characteristics

The data in this section reveal a notable improvement in housing patterns in Rwanda, with the proportion of households residing in Imidugudu increasing significantly from 59% in 2016-17 to 68% in 2023-24, as illustrated in Figure 4.1. Meanwhile, the share of households in dispersed or isolated housing slightly declined from 17% to 16% over the same period.

**Figure 4.1: Changes in specific habitat types**

Source: National Institute of Statistics of Rwanda (NISR), EICV5 & EICV7.

Table 4.1 illustrates the distribution of households by settlement type in Rwanda. At National level, Umudugudu remains the most prevalent settlement, with 68% of households in 2023-24. Other households reside in dispersed/Isolated housing (16%), spontaneous/informal/unplanned housing (9.5%), modern planned urban areas (6%), and integrated model villages (about 1%). At provincial level, the Eastern Province records the highest percentage of households in Umudugudu settlement (84%), while the Northern Province has the lowest (69%), a figure that remained the same from the EICV5. As expected, the City of Kigali has the lowest percentage of households in Umudugudu settlement.

Over the past six years (2016-17 and 2023-24), significant changes have occurred in settlement patterns. Countrywide, the percentage of households residing in Umudugudu has increased from 59% in 2016-17 to 68% in 2023-24. Meanwhile, the percentage of households in dispersed/ Isolated housing remained the same with around 16% across both surveys (EICV5 and EICV7). At the provincial level, the Eastern Province consistently had the highest percentage of households in Umudugudu, although it experienced a slight decline from 87% in 2016-17 to 84% in 2023-24. Conversely, households in Umudugudu in the Southern Province recorded an increase of fifteen-percentage-points, from 57% in 2016-17 to 72% in 2023-24, while households in the Western Province present an increase of around twelve-percentage-points, from 59.5% to 71% over the same period.

The City of Kigali exhibits the most significant growth in Imidugudu settlements, increasing from just 4% in 2016-17 to 28% in 2023-24, an increase of twenty-four-percentage-points. Additionally, Kigali City leads in modern planned urban area, with the percentage of households in this category rising from 17% in 2016-17 to 27% in 2023-24, an increase of ten-percentage-points.

Table 4.2 shows that single house dwellings (House occupied by one household) decreased by four-percentage-points since EICV5, from 89% in 2016-17 to 85% in 2023-24. This type of dwelling is more common in rural areas (93%) compared to urban areas (66%). Notably, the Northern Province leads in this type of dwelling in both surveys, though it has seen a reduction of 3.5 percentage-points from 97.5% in 2016-17 to 94% in 2023-24.

Table 4.3 presents data on the average number of people per bedroom across Rwanda. In 2023-24, the National average was 1.9 persons per bedroom, with a minimal difference between urban (1.9) and rural areas (1.8). The data also reveal that the percentage of households with an average of four or more people sleeping in the same bedroom has slightly reduced, decreasing from 8% in 2016-17 to 5% in 2023-24. The number of persons per bedroom was higher in the City of Kigali and Eastern Province with an average of two persons. In terms household headship, female-headed households tend to have fewer people per bedroom compared to male-headed households. With regards to quintiles, the data indicate that the higher the quintile, the lower the number of people sharing the same bedroom, with 1.5 people per bedroom in the highest quintile and 2.3 people per bedroom in the lowest quintile.

**Table 4.3: Distribution (% and count) of households by number of persons per bedroom, according to province, area of residence, consumption quintile, habitat, and sex of head of HH**

Table 4.4 shows the mean floor area in square meters (m<sup>2</sup>) of households' dwellings in Rwanda. The national mean floor area has increased by two square meters from 40 m<sup>2</sup> in 2016-17 to 42 m<sup>2</sup> in 2023-24. In urban areas, the average dwelling floor area is larger, at 48 m<sup>2</sup>, compared to 40 m<sup>2</sup> in rural areas. However, the mean floor area in urban areas remained unchanged between EICV5 and EICV7. The average floor area of dwellings for households in Imidugudu settlements (43 m<sup>2</sup>) closely aligns with the national average in 2023-24. Wealthier households and those in modern planned areas occupy larger spaces, averaging 56 m<sup>2</sup> and 68 m<sup>2</sup>, respectively.

Source: National Institute of Statistics of Rwanda (NISR), EICV5.

The percentage of households using metal sheets as roofing material increased by nine-percentage-points, from 67% in 2016-17 to 76% in 2023-24. Figure 4.2 shows that metal sheets are the most commonly used roofing material across Rwanda, followed by clay tiles.

**Figure 4.2: Changes in roofing material**

Source: National Institute of Statistics of Rwanda (NISR), EICV5 & EICV7.

Table 4.5 indicates that nearly all households in the city of Kigali and the Eastern Province use metal sheets as roofing material at 99% each. The Southern Province has the lowest percentage of households using metal sheets at 41.5%. However, this represents an increase of fourteen-percentage-points from 28% in 2016-17. This increase in the use of metal sheets corresponds to a shift from clay tiles, as the use of clay tiles decreased from 72% in 2016-17 to 58.5% in 2023-24. Clay tiles remain the predominant roofing material for 58.5% of households in the Southern Province. In urban

areas, metal sheets are used by 94.5% of households compared to 68% in rural areas. Additionally, the use of metal sheets as roofing material has increased in both the lowest and highest quintiles, from 56.5% to 65% and from 84% to 91%, respectively, between 2016-17 and 2023-24.

Table 4.6 presents data on wall construction materials used by households in the country. Overall, the largest proportion (42%) used mud bricks with cement in 2023-24, representing an increase of twelve-percentage-points since 2016-17. The data also reveal a positive trend in the reduced use of mud bricks without cement as a wall material, decreasing from 35% in 2016-17 to 28% in 2023-24, a decrease of six-percentage-points. In rural areas, the use of tree trunks with mud declined significantly by approximately five-percentage-points, from 25.5% in 2016-17 to 21% in 2023-24, as shown in Figure 4.3. Another notable finding is that the percentage of households using burnt bricks and cement blocks increased by around two-percentage-points nationwide, from 3.5% in 2016-17 to 5% in 2023-24. The types of wall materials used vary across provinces. In the City of Kigali, 65% of households have mud bricks covered with cement as the primary wall construction material for their dwellings in 2023-24, an increase of five-percentage-points since 2016-17. In comparison, households in the Western Province had the highest percentage (44%) of dwellings covered with mud bricks as wall construction materials and the lowest percentage (31.5%) of mud bricks covered with cement.

**Figure 4.3: Changes in wall material used in rural dwellings**

Source: National Institute of Statistics of Rwanda (NISR), EICV5 & EICV7.

Table 4.7 describes the floor construction materials of dwellings in Rwanda. Beaten earth remains the mostly used flooring material, though its usage has decreased by ten-percentage-points, from 68% in 2016-17 to 58% in 2023-24. At the national level, cement is the second most common flooring material utilized by approximately one out of three households (35%). This represents an increase of nine-percentage-points since 2016-17. In 2023-24, 60% of urban households used cement as flooring material compared to 24% of rural households.

Another significant finding is the increase in the use of tiles as flooring material, which has risen from nearly 2% in 2016-17 to 4% in 2023-24 nationwide. This type of flooring material is predominantly used by households in urban areas (14%), marking an increase of six-percentage-points from 8% since 2016-17. Figure 4.4 illustrates the rise in the use of cement floors across all provinces, with substantial increases observed: 9% in the Southern, 8% in the Northern, 10% in the Western, and 15% in the Eastern provinces in 2023-24.

**Figure 4.4: Changes in Percentage of HHs living in dwelling with cemented floor by Province**

Source: National Institute of Statistics of Rwanda (NISR), EICV5 & EICV7.

Regarding rainwater management, Table 4.8 presents data on how households manage rainwater from their dwelling's roofs. Overall, in 2023-24, 22% of households had a method for managing rainwater, marking a significant improvement from 14.5% in 2016-17. However, the majority of households (78%) still do not have any rainwater collection or drainage method, except in the City of Kigali, where about 50% of households manage rainwater from their dwellings. Ditches remain the most common method used by 15% of households in 2023-24, up from 9% in 2016-17. The breakdown of rainwater management systems by habitat type indicates that households in modern planned areas predominantly use ditches in both surveys, with usage increasing from 39.5% in 2016-17 to 43% in 2023-24. Additionally, the percentage of households using tanks for rainwater management rose by three-percentage-points, from 2% in 2016-17 to 5% in 2023-24.

**Table 4.8: Distribution (% and count) of households with rainwater catchment systems, by province, area of residence, consumption quintile, habitat, disability status and sex of head of HH**

Concerning the rubbish disposal, Table 4.9 highlights that compost heaps and disposal in bushes/fields remain the most widely used methods by households in Rwanda, with 48.5% and 38.5% respectively in 2016-17. A close analysis reveals a slight increase of three-percentage-points in the use of rubbish collection services at the national level, from 8% in 2016-17 to 11% in 2023-24. The data illustrate that rubbish collection services operate more in urban areas, although there has been a decrease of five-percentage-points from 42% in EICV5 to 37% in EICV7. This reduction in the use of rubbish collection services in urban areas corresponds to an increase of 6.5 percentage-points in the use of compost heaps, rising from 21.5% in EICV5 to 28% in EICV7. In rural areas, 57% of households use a compost heap as their main method of rubbish disposal, and 41% throw their waste in bushes or fields in 2023-24.

**Table 4.9: Distribution (% and count) of households by waste management facilities, by province, area of residence, consumption quintile, habitat, and sex of head of HH**

## Distance to basic public services

This section provides information on mean walking time to essential public amenities, including markets, primary and secondary schools, and health centers. In general, the data indicate that the specified services have become a little bit more accessible to households between EICV5 (2016-17) and EICV7 (2023-24). As illustrated in Table 4.10, rural areas experienced a slight decrease in average walking time to these services during this period. For instance, the proportion of households walking more than 2 hours to reach a health center declined from 8% in 2016-17 to 7% in 2023-24, representing a one-percentage-point decrease. Conversely, the percentage of households walking for less than 30 minutes to a health center increased significantly by eight-percentage-points from 22% in 2016-17 to 30% in 2023-24.

**Table 4.10: Distribution (% and count) of households by walking time to basic services (market/shop, primary schools, secondary schools, health centre), according to area of residence**

EICV7	Mean walking time to service (Minutes)	Time to service (Minutes)						Total nber of HHs (in 000s)

## Relocation

This section deals with information related to household relocation. Table 4.11 shows that, at the national level, 73% of households reported having lived in a different dwelling before moving to their current one. This percentage has decreased by two-percentage-points since EICV5 in 2016-17. The level of household relocation has changed moderately in EICV7. The data also reveal that 46% of households have lived in their current dwelling for less than five years, a reduction of four-percentage-points from 50% in 2016-17.

**Table 4.11: Distribution (% and count) of households that lived in other dwelling before occupying current dwelling and time spent in current dwelling, by province, area of residence, consumption quintile, habitat and sex of head of HH**

Regarding the reasons for household relocation, Table 4.12 outlines the main reasons driving households to move from one dwelling to another. These include 26% of households relocating to a better house in EICV7 compared to 29% in EICV5, building or buying their own house (26% in both EICV7 and EICV5), and moving to a better neighborhood (19% in EICV7 compared to 16% in EICV5) in 2023-24.

**Table 4.12: Distribution (% and count) of households by main reasons causing HHs to change their accommodation, by province, area of residence, consumption quintile, habitat and sex of head of HH**

## Dwelling ownership and rent arrangements

This section provides information on the trend in dwelling ownership status between EICV5 and EICV7. Table 4.13 shows that in 2023-24, the majority of households in Rwanda (72%) own their dwellings, while 21% reside in rented accommodations. However, since 2016-17, the percentage of households owning their dwellings has decreased by four-percentage-points, while those renting has increased by five-percentage-points. At the provincial level, the City of Kigali has the highest percentage of households renting (60% in 2023-24 vs 54% in 2016-17) and the lowest percentage of households owning their dwellings (34% in 2023-24 vs 38.5% in 2016-17). In contrast, the Northern Province has the highest percentage of households owning their dwellings (87% in 2023-24 vs 90% in 2016-17), followed by the Western Province (82% in 2023-24 vs. 85% in 2016-17). Tenancy is more common in urban areas, where almost one in two households lives in rented dwelling (49%), compared to rural areas, where only 10% of households rent their dwellings in 2023-24. Tenancy is most common in the richest quintile, increasing from 34% in 2016-17 to 39% in 2023-24.

The data presented in Table 4.13 reveals that in Rwanda, the majority of households own their dwellings. Estimates in Table 4.14 provide detailed information on dwelling ownership, highlighting a general trend toward joint ownership between household head and his/her spouse. At the national level, over half of the dwellings are jointly owned by the household head and his/her spouse (56%) in both surveys between 2016-17 and 2023-24. The percentage of households with joint ownership is slightly higher in urban areas (57%) than in rural areas (56%). At provincial level, the City of Kigali demonstrates a higher joint ownership rate (63%), followed by the Western Province (62%). The lowest prevalence of joint ownership is observed in the Southern and Eastern Provinces, recording 51% each.

With reference to demographic and income characteristics, Table 4.15 shows that households owning their dwelling are distributed almost equally across the different wealth quintiles ranging between 17 and 23% both in EICV5 and EICV7. A close analysis reveals that renting dwellings is mostly common in the highest quintiles (44%) compared to the lowest quintiles (10%). In addition, the percentage of households renting their accommodation is predominantly found within the age group of 20-39 in both surveys (approximately 73% in 2023-24 compared to 76% in 2016-17). The distribution of households according to size indicates that tenancy is heavily skewed towards smaller households (1-4 people), with 81% in 2023-24 compared to 77% in 2016-17.

## Ownership of home assets

The survey also collects data on household ownership of durable assets. Table 4.16 indicates that refrigerator ownership increased slightly, from 2% of households in EICV5 to 3% in EICV7 at the national level. In contrast, cooking appliance ownership has increased significantly, from 3% in 2016-17 to 9% in 2023-24. At the provincial level, refrigerator ownership is more prevalent in the City of Kigali, where 14% of households own at least one in EICV7, compared to 9% in EICV5. In other provinces, ownership remains low, increasing marginally from less than 1% in EICV5 to 1% in EICV7. Ownership of at least one cooking appliance has grown substantially among households in modern planned areas, by twenty-six-percentage-points rising from 23% in 2016-17 to 49% in 2023-24. Similarly, refrigerator ownership in these areas has increased, with 29.5% of households owning at least one in EICV7, marking a 3.5 percentage-point increase from 25% in EICV5.

## Transport

This chapter deals with households' perceptions of the transport infrastructure in their communities. In Rwanda, the main mode of transportation is basically land transportation. The EICV surveys provide information on household perception of: - distance to transport infrastructure, the use or non-use of transport infrastructure and perceptions about any change in quality of the infrastructure. In addition, this section provides information on trend in household ownership of assets used for transportation such as vehicles, motorcycles, and bicycles between 2016-17 and 2023-24.

### Household perceptions of transport infrastructure

This section focuses on two transport amenities: all-weather roads and public transport stages. Table 5.1 reveals that countrywide, the percentage of households regularly or often accessing all-weather roads increased slightly, from 98% in 2016-17 to 99% in 2023-24. The Southern Province demonstrated an improvement in the usage of all-weather roads reaching 99%, an increase of two-percentage-points since 2016-17, followed by the Northern Province with an increase of one-percentage-point from 98% since 2016-17. Conversely, the Western Province showed a decrease in the usage of all-weather roads, by approximately one-percentage-point to 96.5% of households in 2023-24. As a result, the usage rate in the Western province was the lowest among all provinces. Consequently, 3.5% of households in the Western Province reported using all-weather roads sometimes or not at all in 2023-24. This information aligns with the data presented in Figure 5.1.

**Figure 5.1: Usage rates for all-weather roads in rural areas, EICV7**

As illustrated in Figure 5.2, the data indicate that the majority (95%) of rural households in Rwanda are within a 20-minute walking distance from an all-weather road. Another notable observation from Table 5.2 is the improvement in road provision across all provinces since 2016-17, with access ranging between 89% and 100%. However, the Western Province continues to have the lowest percentage of households accessing an all-weather road within 20 minutes in both surveys (87% in 2016-17 and 89% in 2023-24).

**Table 5.2: Distribution (% and count) of households by walking time to nearest all-weather road, according to province, area of residence and consumption quintile**

**Figure 5.2: Percentage of rural HHs that walk to an all-weather road in less than 20 minutes**

Source: National Institute of Statistics of Rwanda (NISR), EICV5 & EICV7.

Accessibility to all-weather roads is not only assessed by travel time but also by distance. Table 5.3 shows that the mean distance to an all-weather road at the national level decreased from 329 meters in 2016-17 to 287 meters in 2023-24. In 2023-24, 67% of households were within 200 meters of an all-weather road, while 86% were within 500 meters. As expected, the mean distance to an all-weather road was almost twice as high in rural areas (343 meters) as in urban areas (151 meters). At the provincial level, households in the Western Province traveled the farthest (566 meters) to reach an all-weather road, whereas those in the Eastern Province traveled the shortest distance (111 meters). The data also reveal that accessibility to an all-weather road might be related to the type of habitat. Households in integrated model villages and modern planned urban areas located closer to all-weather roads, with mean distance of 120 meters and 96 meters, respectively. In contrast, households in dispersed or isolated housing had to travel further, though the mean distance decreased from 731 meters in 2016-17 to 590 meters in 2023-24.

**Table 5.3: Distribution (% and count) of households by distance to an all-weather road in meters, according to province, area of residence and consumption quintile**

Considering the threshold of two kilometers, accessibility to all-weather roads is very high to households in all regions and is almost to the same magnitude. In urban areas, 100% of households are within 2 km to an all-weather road and 97% in rural areas as shown in Figure 5.3.

**Figure 5.3: Percentage of HHs that are within 2km to an all-weather road by region**

Source: National Institute of Statistics of Rwanda (NISR), EICV5 & EICV7.

Table 5.4 presents the reasons reported by households for the infrequent or non-use of roads. The data show that in 2023-24, 13% of households do not use all-weather roads due to the long distance, an increase of two-percentage-points from 11% in 2016-17. Additionally, it was observed that 77% of households did not use all-weather roads because they did not need them frequently in 2023-24, this represented a slight decrease of two-percentage-points from 79% in 2016-17.

**Table 5.4: Distribution (% and count) of households by reasons for not using all-weather road, according to area of residence and consumption quintile**

Regarding user satisfaction, Table 5.5 shows that at the national level, 62% of households are satisfied with their nearest all-weather road, compared to 79% in EICV5. This indicates a decline in user satisfaction of seventeen-percentage-points. The highest user satisfaction was observed in the Eastern Province, with 74% of households expressing satisfaction, while the lowest was in the Western Province, with 47% in 2023-24. Regarding perceptions of changes in the quality of all-weather roads, 20% of respondents observed an improvement in EICV7. Additionally, 68% of households perceived no change in quality, while 12% noticed a decline in quality over the past 12 months in 2023-24.

**Table 5.5: Distribution (% and count) of households by user satisfaction with all-weather roads and perceptions of changes in quality over last 12 months, according to province, area of residence and consumption quintile**

Table 5.6 presents data on the usage of public transport stages. In urban areas, 76% of the households reported using public transport stage regularly or often in 2023-24, reflecting a decline of one-percentage-point from 77% of the households since 2016-17. In rural areas, 53.5% of the households reported using public transport stage regularly or often, marking an increase of 2.5 percentage-points from 51% between 2016-17 and 2023-24. The highest usage rate of public transport stages was in City of Kigali (84%) while the lowest usage rate is observed in the Western Province, where 51% of households reported that they use public transport stages sometimes or not at all in 2016-17. This associates with information illustrated in Figure 5.4.

Regarding the walking time to the nearest public transport stage, Table 5.7 shows that only 17% of households in rural areas walk less than 20 minutes to reach a public transport stage, compared to 54% in urban areas. This represents a decline of one-percentage-point in rural areas and 11.5 percentage-points in urban areas for access to the nearest public transport stage within 20 walking minutes. The Western Province has the lowest percentage of households with access to a public transport stage in less than 20 minutes (19.5%), which marks an increase of 2.5 percentage-points from 17% in EICV5. Access to a public transport stage within 20 minutes remains consistently higher among households in the richest quintile across both surveys.

**Table 5.7: Distribution (% and count) of households by walking time to nearest public transport stage, according to province, area of residence and consumption quintile**

Table 5.8 presents the reasons for non-use or infrequent use of public transport stages. In urban areas, 85% of households reported that they did not need to use public transport stages often (no need or infrequent need) in 2023-24, compared to 91% in 2016-17. Similarly, in rural areas, 87% of households reported infrequent need for public transport stages in 2023-24, with only 5% indicating that the service was too far away in 2023-24.

Table 5.9 presents data on the satisfaction levels of households using public transport stages. Overall, 77.5% of households report being satisfied, indicating a decrease of 5.5 percentage-points from 83% in 2016-17. The level of user satisfaction in urban areas was higher (81%) compared to rural areas (76%). Additionally, 27% of respondents perceived an improvement in the quality of public transport stages, 68.5% observed no significant change in service quality, and only 4% noticed a decline in quality over the past 12 months in 2023-24.

## Ownership of transportation assets

This section presents information on the ownership of transport assets for private use only, excluding commercial use. Table 5.10 indicates that in 2023-24, the ownership rates for bicycles, motorcycles, and cars were 15%, 2%, and 2%, respectively. However, bicycle ownership declined by two-percentage-points from 17% in EICV5, while car ownership increased by nearly one-percentage-point from 1% in EICV5 at the national level. In the City of Kigali, the percentage of households owning at least one car has risen by almost three-percentage-points from 5.5% in 2016-17. In rural areas, 16% of households own a bicycle, reflecting an increase of two-percentage-points from 14% in 2016-17, driven by households in the Eastern Province, which has the highest bicycle ownership rate (30%). The data also reveal that motorcycles and cars are predominantly owned by households in the richest quintile in both surveys.

**Table 5.10: Distribution (% and count) of households by ownership of transportation assets (bicycle, motorcycle, vehicles), according to province, area of residence, consumption quintile, habitat and sex of head of HH**

# Information and Communication Technology

This chapter discusses the trends in household ownership of Information and Communication Technology (ICT) devices, such as mobile phones and computers. Additionally, it provides information on the distance to ICT services, usage rates, and levels of user satisfaction, comparing data from 2016-17 and 2023-24.

## Ownership of ICT devices and internet access

The ownership of ICT devices is steadily increasing in Rwanda, with some becoming essential to daily life. This section presents information at the household level, where ownership refers to at least one household member possessing an ICT device. Therefore, household-level ICT penetration estimates may be higher than individual-level estimates. The ICT devices considered in this analysis include radio, mobile phones (basic or smartphone), computer, TV set, and Video/DVD player.

At the national level, 85% of households own at least one mobile phone (either basic or smartphone), marking seventeen-percentage-points increase from 67% in 2016-17. Given the significant role of smartphones<sup>2</sup> in facilitating access to information, communication and financial transactions, thereby fostering economic growth and improving quality of life, EICV7 distinguishes between basic phones and smartphones. In 2023-24, 34% of households own at least one smartphone. Smart phone ownership is most prevalent among urban households (62%) and those in the highest wealth quintile (71%). At the provincial level, mobile phone ownership is highest in the City of Kigali, where 96% of households own at least one mobile phone. This is followed by the Western and Northern Provinces, each with 86%, while the Southern Province records the lowest ownership rate with 80.5%.

Nationwide, TV ownership is relatively low, with 14% of households. The highest ownership rate is observed in the City of Kigali (39%), while in other provinces, it ranges between 8% and 12%.

Computer ownership remains limited, with only 7% of households owning a computer in 2023-24, marking a modest increase of four-percentage-points from 3% in 2016-17. The City of Kigali has the highest ownership rate at 20%, whereas in other Provinces, computer ownership remains low, ranging between 4% and 5%. A notable increase is also observed in radio<sup>3</sup> ownership, rising from 74% in 2016-17 to 86% in 2023-24.

Female-headed households continue to be disadvantaged in terms of ICT device ownership. In 2023-24, 76% of female-headed households own a radio, 74% a mobile phone, 4% a computer, and 8% a TV set. In comparison, male-headed households have significantly higher ownership rates: 90% own a radio, 88% a mobile phone, 8% a computer, and 17% a TV set. Overall, ICT devices ownership is the highest among households in the richest wealth quintiles and urban areas in both survey periods as presented in Table 6.1.

The survey also provides information on private internet access at home, as shown in Table 6.2 and Figure 6.2. Overall, 30% of households have internet access at home in 2023-24 (EICV7), representing an increase of thirteen-percentage-points from 17% in 2016-17 (EICV5). The findings indicate that 57% of urban households have internet access in EICV7, up from 38% in EICV5, while 19% of rural households have access in EICV7, compared to 12% in EICV5. Significant improvements are observed across all five provinces. Notably, the percentage of households with internet access in the City of Kigali increased by twenty-seven percentage-points, from 39% in 2016-17 to 66% in 2023-24. In other provinces, the increase in the percentage of households with internet access ranges between nine and eleven-percentage-points, with the Southern province at 21% in 2023-24 compared to 12% in 2016-17, and the Western province at 25.5% in 2023-24 compared to 14% in 2016-17. Mobile phones remain the most common mode of accessing the internet at home (about 96%), followed by landline or cable internet representing (2.5%) and wireless (2%) in 2023-24. Internet access at home is mostly predominantly in the highest quintile in both surveys (41% in EICV5 and 66% in EICV7).

## Public ICT facilities

This section examines the usage rates and satisfaction levels associated with public internet service facilities. Table 6.3 indicates that Rwanda has experienced a significant increase in households utilizing public internet facilities (regularly and often), rising from 1% in 2016-17 to 42% in 2023-24, representing a forty-onefold increase. The highest usage rate is observed in the Northern Province (51%), followed by the City of Kigali (44%) and the Southern Province (42%). In contrast, the Western Province has the lowest usage rate at 33%. Notably, public internet usage has grown substantially across all regions. For instance, in urban areas, the usage rate increased by forty-one-percentage-points, from 3% in EICV5 to 44.5% in EICV7. Similarly, in rural areas, the rate also grew by forty-percentage-points, from nearly 1% in EICV5 to 41% in EICV7. This substantial rise may be attributed to a significant decrease in the percentage of households

unaware of internet services, which dropped from 21.5% in 2016-17 to 4% in 2023-24. Additionally, the expansion of various online services in Rwanda, including the Irembo platform which facilitates access to government services such as passport applications, driving licenses, birth, death, and marriage certificates alongside the growth of digital payment systems like mobile money, is likely a significant contributor to this increase.

**Table 6.3: Distribution (% and count ) of households by usage rates for internet service facility, according to province, area of residence, consumption quintile and sex of head of HH**

Table 6.4 presents data on satisfaction levels among households using public internet services. In 2023-24, 97% of households expressed satisfaction with their nearest internet services, marking a six-percentage-points increase from 91% in 2016-17. That high level of satisfaction was consistent across regions, with 98% in urban areas and 97% in rural areas. Additionally, 38% of households perceived an improvement in the quality of public internet services in 2023-24, representing a seven-percentage-points rise from 31% in 2016-17. Meanwhile, 62% of households felt that the quality of services remained unchanged in both surveys.

## Annex C: EICV7 Contributors

### National Coordination

- MURENZI Ivan, Director General of NISR
- Ndakize Michel, Ag. Deputy Director General of NISR
- Byiringiro James, Survey Program Manager, NISR
- Kayitesi Claudette, Director of SMRP unit, NISR
- Nyirimanzi Jean Claude, NISR training Center Manager

### National Technical Coordination

- Byiringiro James, Survey Program Manager, NISR
- Muhoza Didier, Poverty Statistics Specialist, NISR

### Prices survey National Technical Coordination

- Tuyisenge Methode, Economic Statistics Specialist, NISR

### Sampling

- David Megill, International Consultant
- Byiringiro James, Survey Program Manager, NISR
- Muhoza Didier, Poverty Statistics Specialist, NISR

### Utilities and Amenities Thematic Report, Data Analysis and Report Writing

- NZABONIMPA Jean-Claude, Economic Statistics Classification Statistician

### National field work Coordination

- Juvenal MUNYARUGERERO, Field Coordination Consultant
- Hakizimana Vedaste, Team Leader Statistician

### Regional Data Collection Supervision

- Tuyisenge Methode
- Uwamahoro Pacifique
- Nzabonimpa Jean Claude
- Hakizimana Vedaste
- Muhoza Didier
- Niyomubyeyi Vanessa
- Ntwayingabo Espoir
- Uwitonze Martin
- Neza Nadege
- Habimana Norbert

### Data Processing

- Mukasa Jimmy, Director of ICT
- Sebahire Jean Nepomuscene, Application Admin and Data Processing Officer
- Niyigena Eric, Application Admin and Data Processing Officer
- Ndayishimiye Jean Bosco, Big Data Management Specialist
- Mukanshimiyimana Peruth, Application Admin & Data Processing Officer
- Jean Jacques Faustin Sharangabo, Application Admin & Data Processing Officer

### Cartography

- Bizimungu Clement, GIS

### Proofreading

- Prof. TWARABAMENYE Emmanuel
- HATEGEKIMANA Samson, WASAC

### Editing

- NEEMA Kalisa Grace

### Template Development, Layout Design and Typesetting

- UWAMUNGU Thierry
